## Q1 (3 marks)

*Describe the process of selective breeding.*

- Select individuals from the population with the most desirable characteristics [1]
- Breed these together; select offspring with best characteristics [1]
- Repeat over many generations until the desired characteristic is reliably produced [1]

## Q2 (4 marks)

*Evaluate selective breeding as a method of improving crop yields. Consider both advantages...*

- Advantage: can dramatically improve yield, disease resistance or nutritional content [1]
- Advantage: well-established technique, does not require advanced technology [1]
- Disadvantage: reduces genetic diversity — narrows the gene pool [1]
- Disadvantage: inbreeding risk — increased prevalence of recessive disorders; population vulnerable to new diseases/pests [1]
